# 1 Introduction

## 1.1 Background

- 1.1.1 Jim's Forensics (JF) have been engaged by Penelope Legal (PL) in relation to proceedings with Caelus Engineering (CE).
- 1.1.2 On the 14<sup>th</sup> of September, 2021, PL instructed JF by letter containing a series of instructions on which we were to proceed.

## 1.2 My instructions

- 1.2.1 As a result of the above engagement, on the 14<sup>th</sup> of September, 2021, PL advised me to prepare a report addressing the following issues:
  - (a) **Question 1** - Does the data on the laptop provide any indications regarding the reason for its destruction and disposal? If so, what?
  - (b) **Question 2** - Is there any indication of an attempt to "cover tracks", such as deleting or obscuring data?
  - (c) **Question 3** - Is there any indication of hidden data, *i.e.*, encryption? If so, are you able to make the data usable?
  - (d) **Question 4** - Any other matters that are relevant to the use or misuse of the laptop?
  - (e) **Question 5** - Has the additional information changed opinions on the events which occurred?
  - (f) **Question 6** - Your recommendation regarding any further enquiries and examinations that needed to be conducted.

## 1.3 Provided materials

- 1.3.1 We are provided the following materials from which we are to base our investigations on:
  - (a) a raw image of the hard disk of Alyx Hamilton's laptop,
  - (b) a photo of the collection site, and
  - (c) profiles of the staff at Caelus Engineering.
  - (d) a copy of the logs of entry and exit of personnel from the gates at Caelus Engineering,
  - (e) a screenshot of the CCTV overlooking the entry gates at Caelus Engineering,
  - (f) a dump of the memory of the laptop used by Alyx Hamilton,
  - (g) a copy of the network traffic capture data from Alyx Hamilton's laptop, as well as a log of the TLS keys necessary to decrypt the data,
  - (h) and copies of the log of the email correspondence of Alyx Hamilton and Michael Harris.

## 1.4 Qualifications

- 1.4.1 I am a second year computer science student at the University of New South Wales, currently enrolled in the COMP6845 course, otherwise known as *Extended Digital Forensics*.

## 1.5 Information relied upon

- 1.5.1 I have relied upon the following information in the preparation of my report:
  - (a) a letter containing instructions addressed to JF dated 14<sup>th</sup> of September, 2021,
  - (b) a second letter containing further instructions addressed to JF,
  - (c) an image of the storage of the laptop used by Alyx Hamilton,
  - (d) a dump of the memory of the laptop used by Alyx Hamilton,
  - (e) copies of the logs of the email correspondence of Alyx Hamilton and Michael Harris,
  - (f) a copy of the network traffic capture data from Alyx Hamilton's laptop, as well as a log of the TLS keys necessary to decrypt the data,

- (g) a screenshot of the CCTV overlooking the entry gates at Caelus Engineering,
- (h) a copy of the logs of the entry and exit of personnel from the gates at Caelus Engineering,
- (i) a photo of the collection site, and
- (j) profiles of the staff at Caelus Engineering.

## 1.6 Disclaimer

- 1.6.1 I have made all inquiries which I believe are desirable and appropriate for the purposes of this report. There are no matters of significance which I regard as relevant to my opinions which have been withheld.
- 1.6.2 This report has been prepared solely for the use of PL. In accordance with the usual practice of JF, I expressly disclaim all responsibility to any other person or entity (other than the Court) for any reliance on the content of this report. This report should not be copied or distributed to any other person or entity, other than in connection with the above matter.

## 1.7 Assumptions

- 1.7.1 In preparing this report, I have made the following assumptions:
  - (a) the information described in the background section above is accurate, and
  - (b) the computers identified by CE, and subsequently imaged, were used by Alyx Hamilton.

## 1.8 Structure of this report

- 1.8.1 The remaining sections of this report addresses the following:
  - (a) In Section 2, I set out information with respect to Question 1 above;
  - (b) In Section 3, I set out information with respect to Question 2 above;
  - (c) In Section 4, I set out information with respect to Question 3 above;
  - (d) In Section 5, I set out information with respect to Question 4 above;
  - (e) In Section 6, I set out information with respect to Question 5 above;
  - (f) In Section 7, I set out information with respect to Question 6 above;
- 1.8.2 For convenience, I note that I have organised my findings in the same order as the questions outlined in my letter of instruction. I have also included questions, in some instances paraphrased, from the letter of instruction before presenting my corresponding findings. Additionally, I have referred to the appropriate section number as contained in the letter of instruction in my responses.

## 1.9 Code of conduct

- 1.9.1 I understand that my report is required for the purpose of proceedings in the Supreme Court of New South Wales. Accordingly, I confirm that I have read and agree to be bound by the Expert Witness Code of Conduct (Schedule 7) of the Uniform Civil Procedure Rules 2005 (NSW).

# 2 Question 1: Reason for destruction

## 2.1 Procurement and extraction of evidence

## 2.2 Extraction of evidence

- 2.2.1 This section describes the method with which the evidence laid out in the rest of this report is procured.
- 2.2.2 A disk image is a digital replica of the contents of a physical drive, including any unallocated space.
- 2.2.3 I note that there are no additional cryptographic hashes provided with the disk image, nor is the disk image formatted in a forensically admissible format (such as E01).
- 2.2.4 I extracted the information presented from this point onwards from the provided disk image using the Autopsy forensics toolkit.

Table 1: Google Drive URLs accessed

Date accessed	Title	URL
2020-09-04 14:31:21 AEST	PROJECTS 19:20 - Google Drive	<a href="https://drive.google.com/drive/folders/1S7ETsR">https://drive.google.com/drive/folders/1S7ETsR</a>
2020-09-04 14:27:57 AEST	Shared Drive - Google Drive	<a href="https://drive.google.com/drive/folders/1sinCWR">https://drive.google.com/drive/folders/1sinCWR</a>
2020-09-04 14:27:55 AEST	Shared with me - Google Drive	<a href="https://drive.google.com/drive/shared-with-me">https://drive.google.com/drive/shared-with-me</a>

Table 2: List of attached external USB drives

No.	Device make	Device model	Device ID	Date/Time
1	SanDisk Corp.	Cruzer Blade	4C530300831216101192	2020-09-04 10:11:55 AEST
2	SanDisk Corp.	Product: 55A5	4C530000050910115114	2020-09-04 15:50:09 AEST

## 2.3 Email

2.3.1 I note the existence of an email from [alyx.hamilton@caelusengineering.com.au](mailto:alyx.hamilton@caelusengineering.com.au) sent to the address [johndavis5891@gmail.com](mailto:johndavis5891@gmail.com) at 2020-09-04 16:27:18 AEST with the subject: "*It's done*". Some notable details include:

- (a) The body of the email contains only the following line: *"The files are copying over as we speak. What should I do now? Where do I meet you?"*.
- (b) The email is found on the \\Root - Mailbox\IPM\_SUBTREE\[Gmail]\Bin.
- (c) This email is the only correspondence found between Alyx Hamilton and [johndavis5891@gmail.com](mailto:johndavis5891@gmail.com).
- (d) This email is the last email found on the disk image of Alyx Hamilton's laptop

## 2.4 Accessing Google Drive

2.4.1 Some of the most web history on the device displays the rapid access of various pages in the Google Suite. These are briefly listed in Table 1

## 2.5 Attached USB drives

2.5.1 Table 2 details the make, model, and ID of two external USB drives that are recorded to have been connected to this device, as well as the time they were attached.

## 2.6 Discussion

The email found on 2.2.1 appears to be suspicious from multiple aspects. The most noticeable among which is its cryptic language. Furthermore, the recipient is not an address within Caelus Engineering, nor is it one which otherwise appears in other emails in Alyx Hamilton's mailbox. Lastly, the email is found in the Bin directory, which indicates attempts at hiding it.

The web activity discussed in 2.3.1 were also found to be within temporal proximity of the email discussed above. They directly precede the web history entry belonging to said email. The site accessed, belonging to "Google Drive" and "Google Docs", are benign, but may be used as a method of exfiltrating data.

Likewise, the external USB devices that are noted to have been connected to the device in 2.4.1 are occurrences that are otherwise benign, but may be used as a method of exfiltrating data.

# 3 Question 2: Covering tracks

## 3.1 Deleted email

3.1.1 The email discussed previously in 2.2.1 was found on the folder \\Root - Mailbox\IPM\_SUBTREE\[Gmail]\Bin, which indicates an attempt at deleting the email.

## 3.2 Deleted project archives

- 3.2.1 ZIP archives containing what appears to be project files appear to have been deleted and are found in the 'Recycle Bin', as can be seen in Figure 4 in the appendix.

# 4 Question 3: Encryption

## 4.1 Introduction

- 4.1.1 The NIST<sup>1</sup> defines "encrypt" as to "cryptographically transform data to produce cipher text".

- (a) The NIST<sup>2</sup> further defines "cryptography" as "the discipline that embodies the principles, means, and methods for the transformation of data in order to hide their semantic content, prevent their unauthorized use, or prevent their undetected modification".
- (b) The NIST<sup>3</sup> further defines "cipher text" as "data in its encrypted form".

- 4.1.2 Encryption can therefore be defined as the transformation of data in order to ensure its secrecy and integrity.

- 4.1.3 Encryption is a virtually ubiquitous feature of modern computing technology, as its nature of providing secrecy has a wealth of uses, whether benign (such as protecting one's financial information when performing a transaction online) or malicious (such as obscuring evidence of illegal activities).

## 4.2 Procurement and extraction of evidence

- 4.2.1 This section describes the methodology with which the evidence laid out in the rest of this report is procured.

- 4.2.2 A pcap, or *packet capture* file, is a file which stores network packet data. Such a file is typically procured by capturing the packets which passes through a device (note that this does not necessarily mean that every packet captured involves said device). Such a file logs all network communication that said device "hears".

- (a) A "packet" is a small segment of a larger message, which are sent through computer networks, and are recombined by the recipient to obtain the whole message.<sup>4</sup>

- 4.2.3 JF is provided the pcap file procured from Alyx Hamilton's laptop by CE.

- 4.2.4 A cryptographic hash (using the MD5 algorithm) is provided alongside the pcap file. The calculated hash of the pcap file appears to match the provided hash, as can be seen in Figure 5. Assuming that the integrity of the file containing the provided hash is maintained, this means that the pcap file has not been tampered with throughout the span of time between the calculation of the provided hash and the time of verification.

- 4.2.5 Secure Sockets Layer (SSL), as well as its successor, Transport Layer Security (TLS), are protocols for encrypting, securing, and authenticating communications that take place on the internet.<sup>5</sup> It is used to ensure the secrecy and authenticity of communication over the internet.

- 4.2.6 Because the pcap file contains packets encrypted using SSL, a log of the SSL keys necessary to decrypt them is also provided to JF by CE. A cryptographic hash of the log is also provided, and the calculated hash of the log file appears to match that of the provided hash, as can be seen in Figure 6. Similar to the pcap file, this means that the pcap file has not been tampered with throughout the span of time between the calculation of the provided hash and the time of verification, assuming that the integrity of the file containing the provided hash is maintained.

<sup>1</sup>NIST, "encrypt," in Glossary | CSRC. [Online]. Available: <https://csrc.nist.gov/glossary/term/encrypt>. [Accessed: 22-Jul-2024].

<sup>2</sup>NIST, "cryptography," in Glossary | CSRC. [Online]. Available: <https://csrc.nist.gov/glossary/term/cryptography>. [Accessed: 22-Jul-2024]

<sup>3</sup>NIST, "cipher text," in Glossary | CSRC. [Online]. Available: [https://csrc.nist.gov/glossary/term/cipher\\_text](https://csrc.nist.gov/glossary/term/cipher_text). [Accessed: 22-Jul-2024]

<sup>4</sup>Cloudflare, "What is a Packet?" Cloudflare. Available: <https://web.archive.org/web/20240622023826/https://www.cloudflare.com/learning/network-layer/what-is-a-packet/>. [Accessed: 22-Jul-2024].

<sup>5</sup>Cloudflare, "How does SSL work?" Cloudflare. [Online]. Available: <https://www.cloudflare.com/learning/ssl/how-does-ssl-work/>. [Accessed: 22-Jul-2024].

- 4.2.7 Wireshark is a network traffic analyser.<sup>6</sup> It is a tool that can be used to capture packets from the host device's network interface, creating a pcap file, and analysing pcap files.
- (a) The pcap file can be accessed in Wireshark by clicking *File > Open* on the top menu bar, and then selecting the file from the resulting file explorer dialog.
  - (b) After opening the pcap file, the SSL key log can be imported by selecting *Edit > Preferences* on the top menu bar, selecting *Protocols > TLS* on the preferences menu, and then clicking the *Browse* button underneath *(Pre)-Master-Secret log filename* and selecting the SSL key log file, as can be seen in Figure 8.
- 4.2.8 I note that the first packet contained in the provided pcap file dates to Sep 4, 2020 10:40:22 ACST, and the last packet dates to Sep 4, 2020 16:31:53 ACST, as can be seen in Figure 7
- 4.2.9 Volatile memory is a type of computer memory which loses its content when power is turned off or lost.<sup>7</sup>
- 4.2.10 While not the only type of volatile memory, Random Access Memory (RAM), which is also commonly referred to as *memory*, is the most widely recognised type of volatile memory. Other types of volatile memory, such as CPU registers and caches exist, but are typically very small in size (with sizes measured in bits<sup>8</sup> and kilobytes<sup>9</sup>).
- 4.2.11 Volatility is a framework for extracting digital artifacts from samples of volatile memory, or more precisely, RAM.<sup>10</sup> Specifically, I have used version 3 of Volatility.
- 4.2.12 Volatility can be obtained via the pip package manager for Python. For the sake of reproducibility and convenience, a copy of the Dockerfile I have used to set up my working environment for Volatility 3, alongside instructions on how to use it, is provided in Section 8.2
- 4.2.13 After Volatility 3 is procured, the provided memory image can then be accessed using Volatility 3 by passing it as a command-line argument, like so: `vol.py -f Windows-7-x64-Pro-Snapshot7.7z [plugin name]`, where `Windows-7-x64-Pro-Snapshot7.vmem` is the path to the memory dump. This path assumes that the memory dump file resides in the current working directory; it may need to be adjusted otherwise.
- (a) Volatility 3 comes with a set of plugins, which instructs the tool on how to analyse the memory dump and present the resulting information. An introduction on the various plugins available to both Volatility 2 and 3, and how to use them, can be found on [HackTricks](#).
- 4.2.14 Docker is a tool which creates and manages *containers*, which are isolated environments containing all the code and dependencies of an application.<sup>11</sup> This tool facilitates the creation of standardised, uniform environments across different machines.
- 4.2.15 A *Dockerfile* is a file containing instructions pertaining the creation of a container image.<sup>12</sup> A Docker image is a standalone executable used to create a container;<sup>13</sup> it is effectively a *template* that can be used to instantiate containers.

### 4.3 Network encryption

- 4.3.1 Quick UDP Internet Connections (QUIC) is an encrypted-by-default transport protocol originally developed by Google<sup>14</sup> that is supported by the Google Chrome web browser, beginning small-scale de-

ployments of the original implementation, gQUIC in 2013, and eventually default-enabling its successor, IETF QUIC in 2021 with Chrome 93.<sup>15</sup>

4.3.2 I note that the version of Google Chrome running on Alyx Hamilton's laptop is 84. This can be found by extracting the list of DLLs from Google Chrome processes found on the memory dump using Volatility, as can be seen in Figure 9. The use of memory analysis here further ascertains that this is the version of Google Chrome that is being actively used on Alyx Hamilton's laptop, rather than one that is only installed. Two points of observation can be drawn from this:

- (a) It does not appear to be possible to decrypt the QUIC packets sent to and from Google Chrome in the provided pcap file, because the export of QUIC secrets is only available on version 89 onwards of Google Chrome.<sup>16</sup>
- (b) It appears that the use of QUIC is manually enabled on the Google Chrome browser running on Alyx Hamilton's laptop, as the protocol is only enabled by default from version 93 onwards of Google Chrome.

## 4.4 Analysis and discussion

4.4.1 There are two methods of network encryption discovered from the provided artefacts: SSL encryption, and QUIC encryption.

- (a) SSL encryption is almost ubiquitously enabled by default on most modern programs. It is unlikely that this is intentionally enabled by some party.
- (b) QUIC encryption is likely enabled with intention by some party, as it is not enabled by default on version 84 of Google Chrome, which is in use on Alyx Hamilton's laptop. Furthermore, the toggle to enable the use of QUIC can only be accessed by entering `chrome://flags/` in the browser's URL bar and setting `Experimental QUIC protocol to Enabled`<sup>17</sup>, rendering the possibility that this feature is enabled by accident (without intent) unlikely.

## 4.5 Conclusion

Indications of encryption were discovered, though not always accompanied by indications of *intent* to encrypt.

**Network encryption** Using the provided SSL key log, SSL-encrypted packets were able to be decrypted and "made usable". However, QUIC-encrypted packets, which specifically contains communications to and from the Google Chrome browser running on Alyx Hamilton's laptop, were not able to be decrypted due to the technical limitations present in the version of Google Chrome in use.

# 5 Question 4: Other relevant matters

## 5.1 Procurement and extraction of evidence

5.1.1 This section describes the methodology with which the evidence laid out in the rest of this report is procured.

5.1.2 `mbox` is a family of related file formats, which stores email messages in plain text.<sup>18</sup>

5.1.3 Thunderbird is a free and open source email client, developed by the Mozilla Foundation.<sup>19</sup>

5.1.4 Thunderbird is able to access and read `mbox` files. The instructions on how to do so can be found [in this documentation page from the University of Michigan](#).

<sup>15</sup>Chromium Project, "QUIC, a multiplexed transport over UDP," Chromium. [Online]. Available: <https://www.chromium.org/quic/>. [Accessed: 22-Jul-2024].

<sup>16</sup>Wireshark Foundation, "The TLS/QUIC sessions can't be decrypted," GitLab. [Online]. Available: <https://gitlab.com/wireshark/wireshark/-/issues/17111>. [Accessed: 22-Jul-2024].

<sup>17</sup>M. Geniar, "Enable QUIC protocol in Google Chrome," Mattias Geniar's Blog. [Online]. Available: <https://ma.ttias.be/enable-quic-protocol-google-chrome/>. [Accessed: 22-Jul-2024].

<sup>18</sup>"mbox," Wikipedia. [Online]. Available: <https://en.wikipedia.org/wiki/Mbox>. [Accessed: 22-Jul-2024].

<sup>19</sup>"Mozilla Thunderbird," Wikipedia. [Online]. Available: [https://en.wikipedia.org/wiki/Mozilla\\_Thunderbird](https://en.wikipedia.org/wiki/Mozilla_Thunderbird). [Accessed: 22-Jul-2024].

- 5.1.5 I note that no cryptographic hash is provided alongside the entry and exit logs from the gates, rendering the integrity of the file unverifiable. Throughout the rest of this report, I will work under the assumption that the integrity of the file is maintained and the data contained in this file is accurate. For reference, the copy of the entry and exit logs from the gates which I possess, under the file name *CaelusEng\_Gates\_04092020.xlsx*, has a SHA256 sum of *be8da8b6985d14c03ee964a824886259e398b16f964d26085* and an MD5 sum of *ddaa433b4c866e63b2642391baa99abb*
- 5.1.6 I note that no cryptographic hash is provided alongside the mbox files containing records of the email correspondence of Alyx Hamilton and Michael Harris, rendering the integrity of the file unverifiable. Throughout the rest of this report, I will work under the assumption that the integrity of the file is maintained and the data contained in this file is accurate. For reference, the copy of the email correspondence archives for Alyx Hamilton which I possess, under the file name *Hamilton\_emails.zip*, has a SHA256 sum of *63c75b2ed12b36b4c5ea7e83f14f884690f7db7aed1b63203ee6d6522b779da9* and an MD5 sum of *839ab64e92c698265617b03decdfcab9*, and the copy of the email correspondence archives for Michael Harris which I possess, under the file name *Harris\_emails.zip*, has a SHA256 sum of *945bb71c03863458c8880b006e92f9fd81b65e91d09841b2787266381d6c36cc* and an MD5 sum of *a255b1fb156dcbbaf4f32128b5db62eb*.
- 5.1.7 [VirusTotal](#) is an online service that analyzes suspicious files and URLs to detect types of malware and malicious content using antivirus engines and website scanners.<sup>20</sup> The service provides several means of querying its database and checking a file for virus, including uploading the suspected file, entering the suspected IP address or URL, or entering the hash of the suspected file.

## 5.2 Potential unauthorised use of Alyx Hamilton's laptop

- 5.2.1 The Windows Registry is a database that stores low-level settings for the Microsoft Windows operating system.<sup>21</sup>
- 5.2.2 A *hive* in the Windows Registry is a logical group of keys, subkeys, and values in the registry.<sup>22</sup>
- 5.2.3 The Security Account Manager, or SAM, is a registry hive which contains users' password in hashed format.<sup>23</sup>, specifically under the V key of each user.<sup>24</sup>
- 5.2.4 I note the lack of password protection on Alyx Hamilton's user account on her laptop, as indicated by the null V key on her account's subkey in the SAM hive, which should otherwise contain a hash of her password. This renders the account vulnerable to unauthorised use by persons other than Alyx Hamilton, possibly without her knowledge.
- 5.2.5 I note a chain of email correspondence between Alyx Hamilton and Sarah Jenskins discussing plans to meet at an unnamed "Thai place" for lunch, as can be seen in Figure 10. The last two messages in the chain indicates that the plan is scheduled at around Friday, September 04, 2020 at 13:43 ACST.
- 5.2.6 The provided logs from the entrance gate indicates that Alyx Hamilton left the premises at Friday, September 04, 2020 at 14:05 ACST, and re-entered the premises at 15:20 ACST of the same day, as can be seen in Figure 11. The fact that she likely went out for lunch at this time was corroborated by the near identical exit and re-entry times of Sarah Jenskins, with whom she made the plan.
- 5.2.7 I note that, based on the provided logs from the gate, everyone but Sarah Jenskins and Alyx Hamilton are present within the premises at one point or another throughout the span of time when the pair left for lunch.
- 5.2.8 The pcap file indicates that network activity was still present throughout the duration of Alyx Hamilton's and Sarah Jenskins' absence for their lunch plan. This indicates that the device is powered on and active throughout this period of time.

- 5.2.9 The majority of the packets found in this time frame were encrypted QUIC packets, rendering their contents unreadable. However, the DNS queries made were not encrypted, and can be read, as can be observed in Figure 12.
- 5.2.10 Notable DNS requests are a number of those querying `drive.google.com`, for the following reasons:
- (a) The first DNS request for Google Drive present in the provided packet capture file dates to Sep 4, 2020, 13:47:37.583272 ACST, as can be observed in Figure 13, briefly before the departure of Alyx Hamilton from the premises of Caelus Engineering. While not being a smoking gun, there are factors that may render it plausible for Alyx Hamilton to not be within the vicinity of her device during this time, such as the travel time from her initial location to the entrance gates or meeting Sarah Jenskins after her meeting before departing together.
  - (b) There are no running programs detected in the memory dump that is known to interact with Google Drive. This means that the request must have come from Google Chrome, which would require a human manually accessing the site. Furthermore, it is my opinion that, based on my prior experience of using this service, access to Google Drive is unlikely to be automatic, given the human-centric nature of the service (*i.e.* its design being intended to be interacted with by a human rather than automated tools); it is highly likely that it is caused by a human.

- 5.2.11 It is highly likely, based on the reasons listed throughout points 5.2.4, 5.2.8, 5.2.9, and 5.2.10 that a human was operating Alyx Hamilton's laptop during her absence for lunch.

### 5.3 Suspicious email correspondence involving Michael Harris

- 5.3.1 I note the existence of an email correspondence in Michael Harris' email logs involving him and `johndavis5891@gmail.com` similar to those previously found on Alyx Hamilton's email logs and disk image in point 2.3.1. This can be seen in Figure 14.
- (a) The email message sent from Michael Harris to `johndavis5891@gmail.com`, with the subject "B13 - Done" begins with: "Sorry - reply to this email not the first one."
  - (b) There is no prior correspondence between Michael Harris and `johndavis5891@gmail.com`.
  - (c) There is, however, the email message sent from Alyx Hamilton to `johndavis5891@gmail.com` that was first discovered in point 2.3.1, which was sent 4 minutes prior.
  - (d) The email message sent from Alyx Hamilton's address to `johndavis5891@gmail.com` was sent when she was not present within the premises of Caelus Engineering.
  - (e) The addition of point 5.2.11 paints a possibility that the email in 2.3.1 was sent from Alyx Hamilton's laptop by Michael Harris by mistake.

- 5.3.2 There appears to be prior correspondence between a LinkedIn user named "John Davis" and Michael Harris, indicating that an attempt at a phone call from the former to the latter may have been made, as can be seen in Figure 15.

- 5.3.3 John Davis and `johndavis5891@gmail.com` are likely the same person, given the similarity in name.

### 5.4 Possible malware on Alyx Hamilton's laptop

- 5.4.1 Using Volatility to extract the Spotify executable and calculating its hash (Figure 16) and then querying it through VirusTotal (Figure 17), it can be observed that one of the vendors, namely Trapmine, marks the file as suspicious. While this is not a concrete indication of malware, it is noteworthy given how most benign files are not flagged by even a single vendor.

## 6 Question 5: Change(s) of opinion

**Alyx Hamilton** The evidence provided for the first report, while not definitive, appeared to indicate the possible guilt of Alyx Hamilton regarding the disposal of the laptop. Browsing history containing job openings, correspondence with colleagues expressing discontent with the founder and CEO, David Caelus, and the cryptic email sent to `johndavis5891@gmail.com` painted a picture of a possibly disgruntled employee looking to trade the company's secrets for a better opportunity. However, I was never fully convinced of this conclusion, as a significant driving force behind it was the human impulse to draw conclusions, even with the absence of conclusive evidence.

**Michael Harris** The introduction of new evidence Michael Harris introduced a twist to the initial narrative. The entry and exit logs from the building gates were especially significant; it shed a light on and corroborated a piece of evidence that I had initially overlooked, and that is the correspondence between Alyx Hamilton and Sarah Jenskins. The two pieces of evidence suggested that Alyx Hamilton may not be within the premises when the initial email message sent from her address to [johndavis5891@gmail.com](mailto:johndavis5891@gmail.com) was sent, nor is she likely to be engaged with her email correspondence when out on lunch with her colleague. This, alongside evidence of correspondence between Michael Harris and [johndavis5891@gmail.com](mailto:johndavis5891@gmail.com) and "John Davis" on LinkedIn, prompted me to investigate the possibility of the misuse of Alyx Hamilton's laptop by Michael Harris, which then led me to checking the SAM hive on the disk image of Alyx Hamilton's laptop and discovering that the laptop was not password protected.

**Conclusion** While I was initially somewhat convinced of Alyx Hamilton's guilt in the disposal of the laptop, the new evidence provided made me far less certain of it.

## 7 Recommendations on further enquiries and investigations

Based on the investigation detailed throughout the report, these are the recommendations that I could make:

- 7.0.1 Investigate the LinkedIn account of Michael Harris, especially regarding signs of communication with the account "John Davis".
- 7.0.2 Investigate the phone calls made by Michael Harris using known and accessible mobile devices at around Sep 4, 2020, 16:35 AEST.
- 7.0.3 Investigate any surveillance system available within the premises of Caelus Engineering to verify the whereabouts of Alyx Hamilton's laptop from Sep 4, 14:05 ACST to Sep 4, 15:20 ACST.

# 8 Appendix

## 8.1 Figures

The figure consists of two vertically stacked screenshots of the Autopsy 4.21.0 forensic analysis tool.

**Screenshot 1: E-mail Analysis (Top)**

- Left Panel:** Shows a tree view of the file system. A folder named 'vol3 (Unallocated: 125827072-125829119)' is expanded, revealing sub-folders like 'Videos (3)', 'Public (12)', and 'Windows (86)'.
- Right Panel - E-mail Messages:**
  - Table View:** Shows a list of 87 results. The first few entries are:
 

Source Name	S	C	O	E-Mail From	Subject	Date

Figure 2: Attached USB drives

The screenshot shows the Autopsy 4.2.10 interface with a large number of artifacts and analysis results. The left sidebar lists various案 (Cases) including 'vol3 (Unallocated: 12582702-12582919)', 'File Views', 'File Types', 'Deleted Files', 'MB File Size', 'Data Artifacts' (with sub-items like 'Chromium Extensions (17)', 'Communication Accounts (23)', 'E-Mail Messages (87)', 'Default (Default)', 'Default (87)', 'Favicon (660)', 'Installed Programs (79)', 'Metadata (707)', 'Operating System Information (1)', 'Recent Documents (123)', 'Recycle Bin (3)', 'Remote Drive (1)', 'Shell Bags (124)', 'USB Device Attached (20)', 'Web Accounts (3)', 'Web Bookmarks (20)', 'Web Cache (9253)', 'Web Cookies (1148)', 'Web Downloads (103850)', 'Web Form Addresses (1)', 'Web Form Autofill (10)', 'Web History (4027)', and 'Web Search (139)'. The 'Analysis Results' section includes 'Encryption Suspected (52)', 'EXIF Metadata (36)', 'Extension Mismatch Detected (171)', 'Keyword Hits (2111)', 'User Content Suspected (36)', 'Web Account Type (2)', 'Web Categories (9)', and 'OS Accounts'. The main pane displays a 'Web History' listing with over 40 entries, each showing a timestamp, URL, date accessed, referrer URL, and title. The top navigation bar includes 'Report - Autopsy 4.2.10', 'Case View Tools Window Help', and various icons for file operations and search.

The screenshot shows the Autopsy 4.21.0 interface with a search results page for '4027 Results'. The top navigation bar includes 'Report - Autopsy 4.21.0', 'File', 'View', 'Tools', 'Window', 'Help', and various icons for data sources and analysis. The left sidebar contains a tree view of the file system, including 'File Views', 'File Types', 'Deleted Files', 'MB File Size', 'Data Artifacts' (with sub-items like Chromium Extensions, Communication Accounts, E-Mail Messages, Default, Favicons, Installed Programs, Metadata, Operating System Information, Recent Documents, Recycle Bin, Remote Drive, Shell Bags, USB Device Attached), 'Web Accounts' (with sub-items like Accounts, Bookmarks, Cache, Cookies, Downloads, Form Addresses, Form Autofill, History, Search), and 'Analysis Results' (with sub-items like Encryption Suspected, EXIF Metadata, Extension Mismatch Detected, Keyword Hits, User Content Suspected, Web Account Type, Web Categories, OS Accounts). The main content area displays a table of search results with columns for 'Date Accessed', 'Referrer URL', 'Title', and 'Program Name'. Each result row is a link to a detailed view. The bottom navigation bar includes tabs for Hex, Text, Application, Source File, Metadata, OS Account, Data Artifacts, Analysis Results, Context, Annotations, and Other Occurrences, along with a 'Result' dropdown and a 'Visit Details' button.

eval "$(starship init zsh)"

```

### **8.2.3 Instructions for use**

Install and set up Docker or Podman. Then:

1. Create a new, empty directory and change into said directory.
2. Copy the contents of Section 8.2.1 into a file named `Dockerfile` in the current working directory.
3. Copy the contents of Section 8.2.2 into a file named `.zshrc` in the current working directory.
4. Execute the following command to build the container image: `docker build -t comp6845-report2 .`
5. Execute the following command to initialise a new container from the image that was previously built and enter it: `docker run -it -name=COMP6845-Report2 comp6845-report2 zsh`
